QUALITY ASSURANCE
TEST SUMMARY REPORT

Manual Website Testing & REST API Testing

Assessment repository	QA-Assessment
Website under test	https://www.saucedemo.com/
API under test	https://jsonplaceholder.typicode.com/
API tool	Postman
Testing approach	Manual functional, UI and API testing
Prepared by	Asish Kumar Padhy
Report date	30 October 2026

Purpose

This report summarizes the assessment work completed and recorded for the SauceDemo demo e-commerce website and the JSONPlaceholder simulated REST API. It describes the test scope, execution evidence available, key observations, limitations and overall conclusion.

Execution figures in this report reflect the API progress recorded during the assessment. Website coverage is described by tested modules; a complete website test-case execution count was not available in the information supplied.

1. Executive Summary

The assessment covered two separate systems: a browser-based demo shopping application and a public simulated REST API. Website testing focused on the main customer journey and account-specific behaviour. API testing used Postman to exercise GET, POST, PUT and PATCH requests and inspect HTTP status codes and response bodies.

The recorded API execution shows 7 of 11 planned scenarios executed: 6 passed and 1 was recorded as an observation. No API test was recorded as a failure. Four planned API scenarios remained unexecuted at the time of this report. Several website issues were observed and described below; they should be supported by the corresponding bug-report entries and screenshots in the repository.

2. Scope and Test Coverage

2.1 SauceDemo website

Module	Coverage performed / observations
Login	Valid and invalid login behaviour, including locked-out and other demo user accounts.
Product inventory	Product listing, product details, product images and displayed product information.
Sorting	Product sorting options and observed behaviour for the error_user account.
Shopping cart	Add-to-cart, remove-from-cart and cart item behaviour.
Checkout	Customer information, checkout overview, Finish action and order completion.
Navigation and UI	Continue shopping, Back Home, logout and visible interface behaviour.
Performance observation	Qualitative page-loading and navigation delays with performance_glitch_user; no formal load test.

Demo accounts were used to observe account-specific behaviour. The reported findings refer to the accounts identified in the test notes; they are not generalized to every user account.

2.2 JSONPlaceholder API

The following API scenarios were recorded as executed in Postman. Endpoints are shown relative to https://jsonplaceholder.typicode.com.

Test ID	Method	Endpoint	Observed result	Status
API-01	GET	/posts	Posts list returned; user also reported checking the final post ID (100).	Pass
API-02	GET	/posts/1	Single post details returned.	Pass
API-03	POST	/posts	201 Created; response echoed submitted fields and returned id 101.	Pass
API-04	POST	/posts (empty JSON {})	201 Created; response contained an id. No mandatory-field rule was established from the available API documentation.	Observed
API-05	GET	/posts/101	404 Not Found; expected for the simulated non-persistent write.	Pass
API-06	PUT	/posts/1	200 OK; response reflected the submitted replacement fields.	Pass
API-07	PATCH	/posts/1	200 OK; title was updated in the response and other fields remained present.	Pass

Planned but not executed: API-08 DELETE /posts/1; API-09 GET /posts?userId=1; API-10 GET /posts/1/comments; API-11 GET /posts/9999.

3. API Execution Summary

Metric	Count	Meaning
Total planned API scenarios	11	Scenarios listed in the assessment plan.

Metric	Count	Meaning
Executed	7	API-01 through API-07.
Passed	6	Expected response/status behaviour observed.
Observed	1	Empty-body POST accepted; no documented validation oracle confirmed.
Failed	0	No API failure recorded in the supplied execution notes.
Not executed	4	API-08 through API-11 remain pending.

4. Key Website Findings

The following behaviours were reported during SauceDemo testing. Treat each as a test finding and link it to its detailed defect record and evidence. Severity and priority should be taken from the actual bug-report sheet rather than inferred in this summary.

WF-01 — Product images: With problem_user, multiple product cards displayed the same dog image rather than their respective product images.

WF-02 — Add-to-cart label: With problem_user, the Add to Cart button did not change to Remove after adding a product.

WF-03 — Sorting: With error_user, selecting a sorting option displayed an error alert and sorting did not complete.

WF-04 — Checkout last name: With error_user, the Last Name field did not accept keyboard input on the checkout information page.

WF-05 — Finish action: With error_user, clicking Finish did not complete the order or navigate to the Checkout Complete page.

WF-06 — Performance delays: With performance_glitch_user, delays were observed during login and selected navigation/checkout-related actions. No timings were supplied.

WF-07 — Remove action: A Remove action issue was reported where the product remained in the cart. Confirm the exact account and reproduction steps against the detailed defect record before final submission.

5. Key API Findings

• GET requests retrieved the posts collection and an individual post.
• POST returned 201 Created for both a populated request body and an empty JSON object.
• PUT and PATCH returned 200 OK with response data reflecting the submitted changes.
• GET /posts/101 returned 404 Not Found after the POST request. This is expected for JSONPlaceholder because write operations are simulated and are not permanently persisted.

The empty-body POST result is an observation, not a confirmed defect: the available test notes do not establish a required-field validation rule or expected error response.

6. Limitations and Risks

• SauceDemo is a demonstration application and may intentionally exhibit account-specific behaviours or seeded defects.

• JSONPlaceholder simulates write operations; POST, PUT, PATCH and DELETE behaviour should not be interpreted as persistent database changes.

• Only the selected website modules and API endpoints/scenarios were covered; this is not exhaustive testing.

• Four planned API scenarios (API-08 to API-11) were not executed at the time of reporting.

• The API execution record does not include exported Postman console logs or automated test scripts; results were checked manually in Postman.

• Website performance was assessed through qualitative observations only. No load, stress, endurance or formal performance measurements were performed.

• A complete website test-case execution count and a consolidated pass/fail count were not available in the supplied notes; therefore no website execution percentage is claimed.

• Findings should be cross-checked against the uploaded bug report and screenshots before final submission.

7. Overall Conclusion

The assessment demonstrates practical work in manual functional testing, UI observation, defect identification and REST API testing using Postman. The main SauceDemo customer workflows were examined and multiple account-specific issues were recorded. For JSONPlaceholder, GET, POST, PUT and PATCH requests were executed and their status codes and response bodies were reviewed.

The API work is partially complete: 7 of 11 planned scenarios were executed. Completing the remaining four scenarios, ensuring every website finding has a reproducible bug report and evidence, and checking that all repository files are accessible would strengthen the final submission.

8. Submission Checklist

Deliverable	Status at time of report / action
README.md	Uploaded to the public QA-Assessment GitHub repository (seen in repository screenshot).
Assessment_INterview.xlsx	Uploaded to the repository (seen in repository screenshot). Confirm it contains the intended test case/results sheets.
Bug Report (29_10_2026).pdf	Uploaded to the repository (seen in repository screenshot).
Test Summary PDF	This report; upload it to the repository.
Postman collection JSON	Export and upload if available; not confirmed uploaded.
API test execution sheet	Upload the API execution workbook if it is a separate file.
Screenshots / evidence	Upload relevant website and Postman screenshots; verify they are readable.

Prepared for QA assessment submission. This report reflects the execution details and observations available at the time of preparation; update the counts and pending items if further tests are completed.
